

What is claimed is:

1. An apparatus for receiving and retaining an independently powered light, the apparatus comprising:

an elongated molded body having a first aperture extending through the length of the elongated molded body wherein the first aperture is adapted to receive and retain the independently powered light therein and a second aperture extending through the length of the elongated molded body wherein the second aperture is adapted for attachment to a tool.

2. The apparatus of claim 1, wherein the independently powered light comprises a flashlight.

3. The apparatus of claim 1, wherein the elongated molded body comprises a lower planar portion adapted to stabilize the elongated molded body in an upright position when resting on the planar portion.

4. The apparatus of claim 1, wherein the elongated molded body has a third aperture extending through at least a portion of the length of the elongated molded body.

5. The apparatus of claim 4, wherein the third aperture is configured to receive and retain a power source for the independently powered light.

6. The apparatus of claim 6, wherein the power source comprises a battery.

7. The apparatus of claim 1, wherein the second aperture has threads therein adapted to mate with the tool, wherein the tool has complimentary threads.

8. The apparatus of claim 1, wherein the second aperture is configured to receive a notch protruding from the tool.

9. The apparatus of claim 1, wherein the tool comprises a screwdriver.
10. An apparatus for receiving and retaining an independently powered light, the apparatus comprising:
- a removable elongated molded body having an upper portion with a first aperture therethrough and a lower portion, wherein the upper portion is configured to receive and retain the independently powered light, and wherein the elongated molded body has a second aperture through the lower portion; and
- a tool configured to receive the elongated molded body about the second aperture.
11. The apparatus of claim 10, wherein the independently powered light comprises a flashlight.
12. The apparatus of claim 10, wherein the lower portion comprises a flat base adapted to stabilize the elongated molded body in an upright position when resting on the flat base.
13. The apparatus of claim 10, wherein the elongated molded body comprises a third aperture extending through at least a portion of the lower portion below the second aperture and adapted to receive and retain a power source for the independently powered light.
14. The apparatus of claim 13, wherein the power source comprises a battery.
15. The apparatus of claim 10, wherein the second aperture has threads therein adapted to mate with the tool, wherein the tool has complimentary threads.
16. The apparatus of claim 10, wherein the second aperture is configured to receive a notch protruding from the tool.

17. The apparatus of claim 10, wherein the tool comprises a screwdriver.

18. An apparatus for receiving and retaining an independently powered light, the apparatus comprising:

an elongated molded body having a first retaining means for retaining the independently powered light within at least a portion of the first retaining means and an attachment means for removably mounting the retaining means to a tool.

19. The apparatus of claim 18, further comprising a second retaining means for receiving and retaining a power source for the independently powered light.

20. The apparatus of claim 18, wherein the elongated molded body further comprises support means for stabilizing the elongated molded body in an upright position.
